Graphical user interface is a computer programmed through icons with an easy visualization layout. This is what we're typically used to seeing whether you have windows or finders that layout is a graphical user interface. Now when we talk about command line interface it processes to a computer program representing through lines of text. It represents all the same things that you would see in the finder or windows but processed through purely just text. GUI and CLI are the same in that they hold the same files and data that match each other. If you have a GUI folder that is then represented also in your CLI as directories. They correspond to the same data in computers, just different processes that are represented in different ways.
